

BEFORE THE PUBLIC SERVICE COMMISSION OF SOUTH CAROLINA
COLUMBIA, SOUTH CAROLINA

#19-11800

SEPTEMBER 25, 2019

3:00 P.M.

NDI 2019-21-E:

DUKE ENERGY CAROLINAS, LLC – Allowable Ex Parte Communication Briefing
Regarding the Anderson, South Carolina, Energy Storage and Microgrid
Project

**ALLOWABLE EX PARTE
BRIEFING**

COMMISSION MEMBERS PRESENT: Comer H. ‘Randy’ RANDALL,
Chairman; Justin T. WILLIAMS, *Vice Chairman*; and
COMMISSIONERS Florence P. BELSER, Thomas J. ‘Tom’ ERVIN,
Swain E. WHITFIELD, and G. O’Neal HAMILTON

ADVISOR TO COMMISSION: Joseph Melchers
GENERAL COUNSEL

STAFF: B. Randall Dong, Esq., Legal Advisory Staff; Douglas K. Pratt,
William O. Richardson, John Powers, and Norman Scarborough, Technical
Advisory Staff; Randy Erskine, Information Technology Staff; Melissa
Purvis, Livestream Technician; Jo Elizabeth M. Wheat, CVR-CM/M-GNSC, Court
Reporter; and Hope Adams, Hearing Assistant

APPEARANCES:

HEATHER SHIRLEY SMITH, ESQUIRE, representing DUKE ENERGY
CAROLINAS, together with *ADAM NYGAARD* [*Business Development
Manager, Energy Storage / Duke Energy*], Presenter

JENNY R. PITTMAN, ESQUIRE, Designee of the Executive
Director of the SOUTH CAROLINA OFFICE OF REGULATORY STAFF

PUBLIC SERVICE COMMISSION OF SOUTH CAROLINA

- Presentation Slides

P R O C E E D I N G S

1
2 **CHAIRMAN RANDALL:** Okay. We'll call the
3 allowable ex parte to order, and I'll ask Mr.
4 Melchers to please read the docket.

5 **MR. MELCHERS:** Thank you, Mr. Chairman.

6 Commissioners, we are here pursuant to a
7 Notice of Request for Allowable Ex Parte
8 Communication Briefing. The party requesting the
9 briefing is Duke Energy Carolinas, LLC. The
10 briefing is scheduled for today, here in the
11 Commission hearing room, immediately following the
12 full Commission meeting, which was scheduled for 2,
13 so we're starting a little after 3, here on
14 September 25th.

15 The subject matter to be discussed at this
16 briefing is: Duke Energy Carolinas, LLC's Anderson,
17 South Carolina, Energy Storage and Microgrid
18 Project.

19 The docket's in order. Thank you, Mr. Chair.

20 **CHAIRMAN RANDALL:** Thank you.

21 We'll take appearances from the parties. Or
22 the party.

23 **MS. SMITH:** Good afternoon, Mr. Chairman and
24 Commissioners. I'm Heather Shirley Smith, and I'm
25 counsel for Duke Energy Carolinas.

1 **CHAIRMAN RANDALL:** Thank you, ma'am.

2 Okay. And, Ms. Pittman, if you want to
3 introduce yourself, and go ahead and –

4 **MS. PITTMAN:** Thank you, Mr. Chairman.

5 My name is Jenny Pittman. I'm a Staff
6 attorney for the Office of Regulatory Staff, and I
7 am here as the designee for the Executive Director
8 of the Office of Regulatory Staff at this allowable
9 ex parte being presented by Duke Energy Carolinas.

10 As the ORS representative, it is my duty to
11 certify the record of this proceeding to the Chief
12 Clerk of the PSC within 72 hours that this briefing
13 was conducted in compliance with the provisions of
14 SC Code Section 58-3-260(C). It is the ORS
15 representative's sole responsibility and statutory
16 duty in these proceedings to attend the briefing
17 and file a written certification that such briefing
18 was conducted in compliance with the provisions of
19 this section. I am not a referee, judge, or
20 hearing officer, and I do not and cannot represent
21 the Commission or the presenters. It is up to the
22 presenters, Commissioners, Commission Staff, and
23 all attendees to ensure that the actions here today
24 follow the provisions of 58-3-260. That is the
25 purpose of the statement which you need to sign and

1 return to the desk in the back of the room when you
2 leave today.

3 The requirements of 58-3-260 are, in part,
4 that the allowable ex parte be confined to the
5 subject matter which has been noticed. By limiting
6 discussion to the subject matter noticed, the
7 statute creates a narrow exception to the general
8 prohibition against ex parte communications. In
9 this case, the issue noticed is "Duke Energy
10 Carolinas, LLC's Anderson, South Carolina, Energy
11 Storage and Microgrid Project." I therefore ask
12 that everyone here please refrain from discussing
13 any matters not related to that subject.

14 Secondly, the statute prohibits any
15 participants, Commissioners, or Commission Staff
16 from requesting or giving any commitment,
17 predetermination, or prediction regarding any
18 action by any Commissioner as to any ultimate or
19 penultimate issue which either is or is likely to
20 come before the Commission.

21 Third, I would ask that the participants,
22 Commissioners, and Staff refrain from referencing
23 any reports, articles, statutes, or documents of
24 any kind that are not included in today's
25 presentation. If an item is referenced, it must be

1 provided to me to include in the record.

2 Again, please make sure to read, sign, and
3 return the certification form to Commission Staff
4 which you were given at the door when you came in
5 today. This form needs to be signed by each
6 attendee to certify that the requirements contained
7 in 58-3-260(C) have been complied with at the
8 presentation today.

9 I thank you all for your time and attention.
10 Thank you, Mr. Chairman.

11 **CHAIRMAN RANDALL:** Thank you.

12 Ms. Smith.

13 **MS. SMITH:** Yes, sir. First of all, the
14 company would like to thank the Commission for
15 allowing us to be here today. We were originally
16 scheduled for September 6th, and the Commission
17 graciously allowed us to reschedule this
18 presentation, given Hurricane Dorian.

19 So with that, I will turn it over to our
20 presenter, Adam Nygaard, who is our Business
21 Development Manager for Energy Storage.

22 **CHAIRMAN RANDALL:** Thank you.

23 Mr. Nygaard, welcome.

24 **MR. ADAM NYGAARD [Duke Energy]:** Thank you.

25 Thank you, Commissioners, for the opportunity to be

1 here today.

2 [Reference: Presentation Slide 1]

3 Again, my name is Adam Nygaard. I'm a
4 business development manager working on developing
5 energy storage projects for our company. I've been
6 with Duke Energy for over 10 years, starting
7 originally as a nuclear engineer. But today I'm
8 here to discuss the Anderson Civic Center microgrid
9 and battery energy storage project.

10 [Reference: Presentation Slide 2]

11 Before I get into the specific details of the
12 project, I thought it would be helpful to give a
13 brief overview of microgrids, of battery energy
14 storage, a little bit about Duke's experience in
15 this space, and then dive into the details of that
16 project.

17 [Reference: Presentation Slide 3]

18 So I'm on Slide 3 here, and what I've got here
19 is a simple diagram of a microgrid. I would like
20 to give a simple definition of a microgrid before I
21 dive a little bit into this diagram, and the
22 definition really is the ability for a system to
23 disconnect from the bulk-system grid and be able to
24 provide itself its own power in a self-sustainable
25 way.

1 So in this case what's shown in this diagram
2 is a connection from a customer to the bulk grid
3 and, in this case, a battery-powered microgrid.
4 The microgrid equipment here is simply called a
5 switch, in this diagram, just for simplicity
6 purposes. It really represents microgrid
7 protection and controls, other electrical
8 components, and basically a disconnect switch to
9 disconnect that battery and host customer from the
10 bulk-power grid.

11 So the way this works is, in a utility-owned
12 microgrid that we are proposing in this case,
13 during normal operations when the grid is – the
14 bulk grid, power grid – is up, power is going to
15 and from the grid and the battery. In this case,
16 the battery is able to provide benefits to the
17 bulk-power grid, which benefits all customers.
18 I'll get a little bit more into all the different
19 benefits and use cases of storage in the next
20 slide. But in this case, the way it's configured
21 in front of the meter, you can see that that power
22 goes to and from the grid from the battery, to
23 provide benefits to all customers.

24 In the event that the bulk-power grid goes
25 down and there's an outage, which is shown by the

1 emergency operation piece there in the red lines in
2 the diagram, in that case then the switch
3 disconnects the host customer from the bulk grid
4 and, in that case, the battery would provide power
5 in only one direction to the host customer.

6 [Reference: Presentation Slide 4]

7 So that's a simplified kind of overview and
8 diagram of what a microgrid is, and now I'd like to
9 move on to what energy storage is, and, in this
10 case, battery energy storage.

11 So, energy storage in general can consist of
12 many different things. As shown in the bottom five
13 pictures here, there is thermal storage,
14 compressed-air storage, flywheel storage. I'm sure
15 you've heard of Duke Energy's pumped-hydro storage
16 facilities. And in this case today, we're focused
17 on battery energy storage.

18 So what is battery energy storage? In this
19 case, we're talking about lithium-ion technology.
20 There's many different sub-chemistries of lithium-
21 ion, but the lithium-ion chemistry of battery
22 energy storage is what we are focused on for this
23 project, in particular.

24 The energy storage in this case for the bulk-
25 system power benefits is able to do many different

1 things – as I’m sure you’ve heard, battery energy
2 storage tied to renewables – so it is capable of
3 helping with the intermittency of renewables and
4 firming the grid in that standpoint. In this – in
5 the case of the Anderson project, it will not be
6 providing that use case; it’s not required or
7 necessary. That is one use case, though. Another
8 use case is to control voltage and regulate
9 frequency, so basically maintaining the grid,
10 balancing generation with demand. Another thing
11 that energy storage does is it helps make the grid
12 more reliable. And, finally, in times of peak-
13 power and low-power needs, it’s able to shift power
14 from times of low demand to times of high period
15 demand. That can potentially allow us to eliminate
16 or reduce the amount of peaking units in the
17 future, if energy storage continues its sort of
18 downward trend.

19 So one of the things I wanted to bring up is
20 the lithium-ion technology. That is nothing new.
21 It’s in your phones, it’s in your laptops. It’s
22 been a widely adopted technology. And so the
23 question is, well, so, why are we just getting into
24 this today? And that’s really because of this next
25 slide –

1 [Reference: Presentation Slide 5]

2 – which is showing the cost curve of lithium-ion.

3 So Duke Energy has been following energy
4 storage for, probably, well over 10 years now. But
5 the reason that it makes sense for us to adopt this
6 technology now for utility purposes is because of
7 the cost. As you can see, it's probably similar to
8 kind of how solar-panel prices declined in the
9 early 2000s, and that's what we're seeing here
10 today with lithium-ion batteries.

11 This is really being driven by the electric
12 vehicle market, but it's something that we'd like
13 to take advantage of as a utility, to benefit our
14 grid and our customers.

15 [Reference: Presentation Slide 6]

16 I wanted to give a little bit of a flavor just
17 for how much energy storage and what Duke's
18 experience has been. As I mentioned, we've got
19 over 10 years of experience. We have – we are
20 deploying 50 megawatts of energy storage at seven
21 different sites in Florida. We are – currently
22 have two different 5 megawatt projects under
23 construction in Indiana, totaling 10 megawatts.
24 And we've got 10 megawatts planned in Ohio, as
25 well.

1 I saved the Carolinas for last. We have 290
2 megawatts filed in our latest IRP plan, which
3 includes the Hot Springs and Asheville/Rock Hill
4 developments that are currently under development
5 in the Western Carolinas.

6 [Reference: Presentation Slide 7]

7 So, now moving to the Anderson Civic Center.
8 So before I dive into the how-big and exactly-
9 what's-going-on, the question is why did we choose
10 the Anderson Civic Center, and the reason is we
11 could put these batteries right next to our
12 substations to provide all those bulk-grid benefits
13 that I just kind of walked through, but we thought,
14 you know, what if we have host customers who –
15 critical-needs host customers who are willing to
16 host these facilities, that can also then provide
17 that backup power benefit. We can't provide that
18 backup power benefit to them, if it's located at a
19 substation far away from them.

20 So, in this case, we had spoken with an
21 emergency preparedness counselor at the South
22 Carolina Department of Health and Environmental
23 Control and identified several different sites, but
24 have narrowed in on the Anderson Civic Center. So,
25 the Anderson Civic Center serves as the State's

1 largest special-medical-needs shelter, which are
2 used during times of hurricanes, ice storms, et
3 cetera. You know, I'm sure you Commissioners are
4 aware in the last 24 months we've seen three major
5 storms hit the Carolinas – Hurricane Florence,
6 Winter Storm Diego, and most recently Hurricane
7 Dorian – which, you know, caused several outages.
8 And in this case, you know, this type of facility
9 would be open for evacuees from those areas that
10 are hit.

11 So it serves many different uses that are
12 listed on this site. So, that's one reason, is
13 that the Anderson Civic Center serves a critical
14 purpose. The other two reasons that made this a
15 good facility for energy storage is its proximity
16 to a substation – in this case, the Whitehall
17 Substation, which I've got some maps and some
18 slides coming up here, to show you that – and,
19 also, that there was available land and adequate
20 land available for the project.

21 [Reference: Presentation Slide 8]

22 So how does the Anderson Civic Center site
23 work and what are the benefits going to be to both
24 the Duke Energy Carolinas customers and the
25 Anderson Civic Center itself?

1 This is, obviously, a similar graphic to what
2 was shown earlier, but, in this case, during normal
3 operations we expect to use the battery, as the
4 utility, to provide frequency regulation to the
5 Duke Energy Carolinas grid and to also do peak-load
6 shaving, and that basically just means charging the
7 battery, probably at night, and discharging it
8 during the day when demand is high.

9 The Anderson Civic Center would be able to
10 receive the backup power benefits of the project,
11 in the event that the bulk-power grid goes down.
12 We expect various calculations that – the question
13 of, “Well, how long could it power the facility,”
14 depends on exactly how much energy the facility is
15 using at the time. So the answer to that is, it
16 depends. But we – our estimates are between 30 and
17 40 hours of backup power that the battery would be
18 able to provide.

19 The other piece here is – that I wanted to
20 mention – is what contracts or what changes. As
21 you can see, the project, the battery, and the
22 microgrid equipment are in front of the meter, so
23 it’s on the utility side. So we’re not proposing
24 any different rate, any – you know, there’s no
25 change from an electrical configuration or rate

1 structure for the Anderson Civic Center as we would
2 propose it. The only contract would be the ground
3 lease between Duke Energy Carolinas and Anderson
4 County, which is the owner of the property and the
5 facility, and that would be a zero-dollar land
6 lease, which has been executed between the parties.

7 [Reference: Presentation Slide 9]

8 So I wanted to give a little bit of a flavor
9 of where we're at with the project in development.
10 So to the point I just made, we have executed the
11 land lease with Anderson County. We had to do that
12 before we were able to file an interconnection
13 request. So that interconnection request is
14 currently being studied. We hope that that
15 interconnection study process finishes up by the
16 end of 2019.

17 We also hope to file an application with the
18 Commission in the month of October. And if the
19 interconnection study results are positive towards
20 the end of the year, then we would expect to
21 proceed with a competitive procurement to do the
22 engineering, procurement, and construction of the
23 project itself.

24 We take safety and quality very seriously, so
25 we are very picky about what equipment and what

1 suppliers construct these projects for us. But
2 that would occur, hopefully, in the first quarter
3 of 2020, followed by selection of that vendor in
4 the second quarter of 2020, and we would hope for
5 the product to be placed in service in early 2021.

6 [Reference: Presentation Slide 10]

7 The next three slides, I thought, would just
8 give a visual of where this project is, what it
9 looks like to some degree. So this is higher-level
10 and it will continually zoom in as I go through.
11 But this shows where the Whitehall Substation is,
12 to the lower left-hand corner of the slide. It
13 then follows sort of the light blue distribution
14 feeder line, which serves the Anderson Civic
15 Center, and shows the proposed battery energy
16 storage system location there in the yellow square,
17 just to the north of the Anderson Civic Center.

18 [Reference: Presentation Slide 11]

19 The next slide shows kind of how that facility
20 would be connected to that distribution feeder, and
21 a little bit higher-level view of the site. In
22 this case, we are proposing a 5 megawatt, 5
23 megawatt-hour battery.

24 [Reference: Presentation Slide 12]

25 And then, finally, a zoomed-in picture of the

1 facility itself. You can see there are four
2 battery energy storage containers, and then two
3 squares to the right of that show basically a pad
4 that's supposed to represent an inverter, a
5 transformer, and other related switchgear for the
6 project. Also shown is the fence boundary and
7 lease boundary for the project.

8 [Reference: Presentation Slide 13]

9 So in closing, I guess, before I get to any of
10 your questions, I just wanted to review the project
11 benefits again.

12 The frequency-regulation and peak-load-shaving
13 benefits really benefit all Duke Energy Carolinas
14 customers in the State of South Carolina.

15 The power quality and reliability on that
16 feeder would be improved, and that would benefit
17 all customers on that feeder.

18 Specifically, the Anderson Civic Center would
19 receive backup power during times of when the bulk-
20 grid power is down.

21 And then some ancillary, but still relevant,
22 benefits to Duke Energy from an energy-storage-
23 development perspective are integrating these
24 energy storage assets into our operations and
25 confirming the assumptions that we have around

1 costs and maintenance, for future projects.

2 With that, Commissioners, I welcome any of
3 your questions.

4 [Reference: Presentation Slide 14]

5 **CHAIRMAN RANDALL:** Great. Thank you, Mr.
6 Nygaard. We'll entertain questions from
7 Commissioners.

8 I just had one thing: I visited, at NARUC, a
9 battery-storage facility, and I think it was about
10 that – it was connected to a natural gas plant, and
11 they used it for voltage regulation, mostly – well,
12 everything. But it was made up of – the batteries
13 are a whole lot of – I always thought these were
14 going to be huge batteries, but it was a whole lot
15 of small batteries in trays and welded together,
16 whatever. I guess that's the technology that's
17 there right now, right?

18 **MR. ADAM NYGAARD [Duke Energy]:** That's right.
19 It's cell – kind of, usually, packetized cell is
20 the typical lithium-ion technology. There are
21 various other ones. And then those cells are
22 stacked to create a module; those modules are
23 stacked to create a battery pack. And then, in
24 this case, those battery packs are connected to
25 create these battery energy storage systems. But

1 typically, many of the times, the same cells that
2 are in these battery energy storage systems are the
3 same, if not very similar, cells to what you have
4 in your handheld devices.

5 **CHAIRMAN RANDALL:** Commissioners, questions?
6 Commissioner Ervin.

7 **COMMISSIONER ERVIN:** Thank you, Mr. Chairman.
8 It's good to have you with us today.

9 **MR. ADAM NYGAARD [Duke Energy]:** Thank you.

10 **COMMISSIONER ERVIN:** I appreciate your
11 presentation. What do you believe is the useful
12 life of the batteries as they currently are going
13 to market?

14 **MR. ADAM NYGAARD [Duke Energy]:** That's a
15 great question, and I think it – and thank you,
16 Commissioner Ervin, for that question. I think the
17 answer depends on what's the specific use case. I
18 would generally say 15 to 25 years, but, again, it
19 depends on how you use the battery and what it's
20 being used for. The more times you cycle it, the
21 faster it will degrade. But generally, 15 to 25
22 years is the industry kind of norm, right now.

23 **COMMISSIONER ERVIN:** Do they require a lot of
24 maintenance? Routine maintenance?

25 **MR. ADAM NYGAARD [Duke Energy]:** My

1 understanding is they do not. My understanding is,
2 typically, one to two visits a year, is my
3 understanding. But that is information that we –
4 we have experience with, I would say, R&D projects,
5 so we're around them all the time. As far as
6 projects that are this size, that's certainly
7 something that we can expect – we'll be monitoring
8 them 24/7, but as far as maintenance activities,
9 there is very little maintenance.

10 **COMMISSIONER ERVIN:** Well, I commend you on
11 the project. And I'm familiar with that area,
12 having lived in Anderson and been to the Civic
13 Center on many occasions. It's a great facility
14 and an appropriate site. You have a lot of room
15 there to grow and expand, if you wanted to. And
16 I'm sure you've met our County Administrator, Rusty
17 Burns? Rusty is really a visionary when it comes
18 to long-term planning, so you probably picked up on
19 that.

20 **MR. ADAM NYGAARD [Duke Energy]:** [Nodding
21 head.]

22 **COMMISSIONER ERVIN:** But he and the Council
23 have done a great job, I think, in trying to expand
24 the public infrastructure in the County. And I'm
25 hopeful that you'll have an opportunity to, you

1 know, continue to work and develop in that area.
2 I'm wondering if you – have you given any thought
3 to collocating a battery storage facility maybe
4 next to a trauma hospital or – I know they have
5 generators, but I assume they're limited in terms
6 of the length of time they can use generators. Is
7 that – would that be a useful way to perhaps use
8 them?

9 **MR. ADAM NYGAARD [Duke Energy]:** Yes, sir. We
10 are working with several different hospitals at
11 this time. I'd say they're probably a little bit
12 earlier stage development than this project is
13 currently at, so that's probably about as far into
14 the details as I'd want to give at this point.

15 **COMMISSIONER ERVIN:** Sure.

16 **MR. ADAM NYGAARD [Duke Energy]:** Certainly,
17 critical facilities –

18 **COMMISSIONER ERVIN:** Right.

19 **MR. ADAM NYGAARD [Duke Energy]:** – are at the
20 top of our radar for this particular use case.

21 **COMMISSIONER ERVIN:** The other possibility
22 might be law enforcement centers, where you've got
23 911 communications located. It would seem that,
24 you know, in a disaster scenario, you'd certainly
25 want your law enforcement to have ready access to

1 power. So that might be another area you could
2 look at, particularly in the metropolitan areas,
3 you know, densely populated areas. But I'm excited
4 about this project. I think it has a lot of
5 potential, and I commend you on all your efforts.

6 **MR. ADAM NYGAARD [Duke Energy]:** Thank you,
7 Commissioner.

8 **CHAIRMAN RANDALL:** Thank you.
9 Commissioners. Commissioner Williams.

10 **VICE CHAIRMAN WILLIAMS:** Thank you, Mr.
11 Chairman.

12 Good afternoon, sir.

13 **MR. ADAM NYGAARD [Duke Energy]:** Good
14 afternoon.

15 **VICE CHAIRMAN WILLIAMS:** Thank you for being
16 here today. I enjoyed your presentation. On the
17 batteries and the implementation of the batteries,
18 it's very interesting. In terms of shoring up the
19 grid, do you think that, in the future, this
20 technology will be useful during, like, storms or
21 weather events where, say, there's a power outage
22 in a residential area?

23 **MR. ADAM NYGAARD [Duke Energy]:** Commissioner
24 Williams, absolutely, thank you for the question.
25 It would absolutely be useful in – many times,

1 these microgrids have black-start capabilities, so
2 the power goes out but then these microgrids are
3 able to sense that outage, disconnect from the
4 grid, and then black-start, and restart the area
5 that is still connected in that microgrid area.

6 **VICE CHAIRMAN WILLIAMS:** How do you think the
7 existing grid – bulk grid, if you will – will need
8 to change or improve in order to, I guess, stay
9 current with the implementation of new technology
10 like microgrids?

11 **MR. ADAM NYGAARD [Duke Energy]:** Another great
12 question. And I guess I would say that the changes
13 that will have to occur are really being determined
14 through that interconnection process that we're
15 actually in the middle of right now for the
16 Anderson County Project. And that, as I'm sure
17 you're all aware – it sounds like there was a lot
18 of interconnection work in the meeting right before
19 this, or reference to it – the reason for that
20 interconnection process is to protect the bulk-grid
21 power system that all of our customers have paid
22 for, right? And so the interconnection study
23 results will tell us what facilities and what
24 equipment we'll be required to place with this
25 project, to protect that bulk-power system, such

1 that we aren't negatively impacting it. So those
2 interconnection study results will ultimately
3 answer your questions of how will the grid need to
4 change. And the answer is, the equipment and
5 technology is there today to incorporate battery
6 energy storage and microgrids into our bulk-power
7 grid.

8 **VICE CHAIRMAN WILLIAMS:** Thank you. One last
9 question. From what you know today, do you see the
10 trend for all this technology – the batteries and
11 other supporting technology – are the prices
12 steadily decreasing? Is that the trend?

13 **MR. ADAM NYGAARD [Duke Energy]:** That is the
14 trend, Commissioner. As that graph has shown and
15 as we have seen, ourselves, in our experience in
16 other states.

17 **VICE CHAIRMAN WILLIAMS:** All right. Thank
18 you.

19 **MR. ADAM NYGAARD [Duke Energy]:** Thank you.

20 **CHAIRMAN RANDALL:** Thank you.

21 Commissioner Whitfield.

22 **COMMISSIONER WHITFIELD:** Thank you, Mr.
23 Chairman.

24 Thank you for being here, Mr. Nygaard.
25 Certainly appreciate your presentation and found it

1 informative. I would note right off, what you were
2 just saying, I guess, with Commissioner Williams,
3 how particularly you have pushed your projects here
4 in the DEC service area, I noticed in terms of
5 megawatts, Carolinas have the most on your, I
6 think, page six, when you compare it to projects in
7 Indiana and Florida and other Duke-served states,
8 and even Ohio, it looks like, you've definitely
9 focused a lot of your efforts here in the Carolinas
10 and a lot of your projects here in the Carolinas,
11 and we certainly commend you for that. You've
12 already answered one of my questions, to
13 Commissioner Williams, did it have black-start
14 capabilities, and that was what I was going to ask
15 you. And back to the Anderson site, I'm familiar
16 with the Civic Center, as well – not as familiar as
17 Commissioner Ervin, maybe, but I think the other
18 Commissioners are, too, as we've had several night
19 hearings in that location over the years, in
20 various cases. And it's a big facility, and
21 obviously multipurpose use, and it looks like, from
22 your DHEC regs, that you meet a lot of – you know,
23 it meets a lot of goals here.

24 My question to you is, when you – you know,
25 based on these DHEC regs and multipurpose uses –

1 and many of them urgent, critical – could be
2 urgent, critical emergency uses, were there – is
3 there anything that has to be done to the structure
4 itself? I see your – looking at your maps, where
5 the actual batteries' layout is, and then you have
6 the inverters. I cannot – you know, I can see how
7 close in proximity that is, but does it also
8 require you to do other things to the site, such as
9 to the building, itself, or to things leading into
10 the Civic Center?

11 **MR. ADAM NYGAARD [Duke Energy]:** It really
12 does not, actually, require anything to the
13 building. And that is because we are configuring
14 it to be – to basically connect in front of the
15 meter. So where the, basically, meter is for this
16 and equipment is served, we will connect somewhere
17 between the meter for this facility and where they
18 receive service, and our distribution feeder. Then
19 on the other side of that connection will be that
20 kind of disconnect switch that's shown in that
21 diagram, where it will basically switch off, and
22 then that's what makes the microgrid or the –
23 basically, the only things connected then are the
24 battery and the Civic Center.

25 The only thing that I would say we would want

1 to install is sort of a screen inside the Anderson
2 Civic Center, and this would require a little bit
3 of communications, but that would show “This is the
4 current level of charge of the battery. This is
5 the current usage of the Anderson Civic Center.”
6 And then that can calculate “This is the number of
7 estimated hours of backup power that you would
8 have.” And we would want the facility manager, or
9 whoever is manning that facility during an
10 emergency time, to have that information on a panel
11 so that they can then make decisions on, “Hey, do I
12 turn lights off in these rooms, or air
13 conditioning, or turn the kitchen off?” Make the
14 decisions they need to regarding the load side that
15 we, as Duke Energy, don’t have control over, so
16 that they can extend the number of hours that that
17 battery can power the facility in the event of an
18 outage.

19 So the simple answer to your question is, no,
20 there are not any building upgrades required. We
21 would want to have some sort of panel in there to
22 be able to give them information.

23 **COMMISSIONER WHITFIELD:** I certainly
24 appreciate your answer. That information could
25 become critical in an emergency situation, to

1 preserve the amount of life or energy left in
2 storage, to ration it out in a situation like that.
3 And I see your proximity to the substation, which
4 you acknowledged is close enough – I can see on the
5 other map – is close enough for you to have a
6 facility like this, to be able to draw the energy
7 you need to have that storage there. But as you
8 said in the microgrid, in the event that something
9 like that happens, when everything disconnects, as
10 you said right there, the only thing that's going
11 to be left would be the Civic Center. Is that what
12 I – that's the way I understand it. Right?

13 **MR. ADAM NYGAARD [Duke Energy]:** That is
14 correct, Commissioner. And we have entertained
15 adding other facilities that are connected to that
16 facility – actually, with Mr. Burns, the gentleman
17 Commissioner Ervin mentioned – but ultimately
18 decided against it, because it would take away from
19 the number of hours of backup power that were
20 available to the Civic Center. So we decided to
21 focus on the Civic Center, alone.

22 **COMMISSIONER WHITFIELD:** And you're talking –
23 what you're talking about – you weren't necessarily
24 talking about other emergency; you're just talking
25 about other facilities.

1 **MR. ADAM NYGAARD [Duke Energy]:** That's
2 correct.

3 **COMMISSIONER WHITFIELD:** I see.

4 Well, that's all I have, Mr. Chairman. Thank
5 you.

6 **CHAIRMAN RANDALL:** Thank you.

7 Commissioner Hamilton.

8 **COMMISSIONER HAMILTON:** Thank you, Mr.
9 Chairman.

10 Welcome. Happy to have you. Excellent
11 presentation. It appears the automobile industry
12 has done a little more moving forward with the use
13 of this in battery than probably other people, but
14 we're happy to see you here today, and the activity
15 that you have in Anderson, going on. The one
16 question that's still out there everywhere I go is
17 cost-effectiveness and when do you think we'll
18 reach that level? I know you can – I looked at
19 your slide eight, and it looks like it's going to
20 be a while.

21 **MR. ADAM NYGAARD [Duke Energy]:** Thank you for
22 the question, Commissioner Hamilton. So, in
23 certain use cases, I would say that battery energy
24 storage is a cost-effective alternative to
25 traditional investments – traditional investments,

1 whether that's running an additional feeder; in
2 some cases, I think in the western part of the
3 United States, you're seeing storage being added to
4 solar to displace traditional fossil-fuel
5 generation. So I think battery energy storage in
6 certain use cases is cost-effective. It just
7 depends on what the alternative is that it's being
8 measured to, right?

9 So, but to that point, we continue to see
10 battery energy prices decrease. We continue to
11 learn about ways we can use batteries to make our
12 grid more efficient, and to make – to make cost
13 savings and make the grid more efficient for our
14 customers.

15 **COMMISSIONER HAMILTON:** It seems to have been
16 a very slow process of getting to where you are
17 today. And how do you think it's going to move in
18 the future? Is there enough activity going on and
19 enough people doing the proper research?

20 **MR. ADAM NYGAARD [Duke Energy]:** Yeah, I
21 believe so. The Electric Power Research Institute,
22 EPRI, is very involved in energy storage. The
23 Energy Storage Association is another one that has
24 grown tremendously. Actually, right now, the
25 largest solar power conference in the United States

1 is taking place out in Utah, in Salt Lake City, and
2 they are all actually just talking about energy
3 storage, is what everyone's saying out there. All
4 the articles coming out of that conference – it's
5 supposed to be for solar – is actually about energy
6 storage.

7 And so there's a lot of attention on energy
8 storage. As these factories that are really under
9 construction right now to build batteries in mass
10 quantities come out, then that will drive the
11 prices even lower and continue to drive
12 efficiencies for battery energy storage technology.

13 **COMMISSIONER HAMILTON:** Do you know any places
14 that it's being used with solar now, to make this
15 more effective?

16 **MR. ADAM NYGAARD [Duke Energy]:** Absolutely.
17 There's several solar-plus-storage sites, mostly in
18 the Western United States. We do have a microgrid
19 that I would say, really, is a small type version
20 of this in South Charlotte. It's called the
21 McAlpine microgrid. So it is a solar-plus-storage
22 microgrid that's capable of providing backup power
23 to a fire station, in this case Fire Station 24.
24 Again, it's very similar, but it also includes some
25 solar, which the Anderson Civic Center Project does

1 not.

2 **COMMISSIONER HAMILTON:** Thank you very much.
3 Appreciate you being here, again.

4 **MR. ADAM NYGAARD [Duke Energy]:** Yes, sir,
5 thank you.

6 **CHAIRMAN RANDALL:** Thank you.

7 Commissioner Belser.

8 **COMMISSIONER BELSER:** Good afternoon. On your
9 slide number five, there are a couple of terms I'd
10 like to ask you about, please. First of all is
11 where it says 2024 and 2030 "implied price"? Is
12 that just like a projected price? Is that –

13 **MR. ADAM NYGAARD [Duke Energy]:** Commissioner
14 Belser, that is my understanding. This slide comes
15 from Bloomberg New Energy Finance –

16 **COMMISSIONER BELSER:** Okay.

17 **MR. ADAM NYGAARD [Duke Energy]:** – so I guess
18 I couldn't speak for them, necessarily, but I
19 would – my assumption is that "implied" means
20 that's their forecasted price, because it's
21 probably hard to tell exactly what number is shown
22 in 2024.

23 **COMMISSIONER BELSER:** And then the other one
24 is – come down below the X axis – I think that's X.
25 Maybe Y. Whatever. It says "18% learning rate"?

1
2
3
4
5
6
7
8
9
10
11
12
13
14
15
16
17
18
19
20
21
22
23
24
25

I don't understand what "learning rate" is.

MR. ADAM NYGAARD [Duke Energy]: So I think that implies that there is an 18 percent – I don't know if that is saying a cost decrease year-over-year – probably not quite that. It's probably some sort of learning rate of learning the – decreasing the battery energy storage pack cost versus the other things that go into a battery, such as the balance of plant and switchgear, et cetera.

COMMISSIONER BELSER: Okay. Thank you very much. Appreciate your presentation today. Thank you.

MR. ADAM NYGAARD [Duke Energy]: Thank you, Commissioner Belser.

CHAIRMAN RANDALL: Commissioners, any other questions?

[No response]

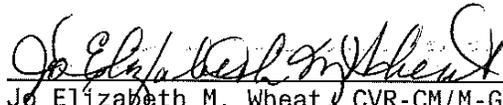

Okay. If not, Mr. Nygaard, we appreciate you being here. Thank you. We enjoyed your presentation. And we are adjourned

[WHEREUPON, at 3:35 p.m., the proceedings in the above-entitled matter were adjourned.]

C E R T I F I C A T E

I, Jo Elizabeth M. Wheat, CVR-CM-GNSC, Staff Hearings Reporter for the Public Service Commission of South Carolina, do hereby certify that the foregoing is, to the best of my skill and ability, a true and correct transcript of all the proceedings had regarding a requested allowable ex parte briefing in the above-captioned matter, according to my verbatim record of same;

IN WITNESS WHEREOF, I have hereunto set my hand and seal, on this the 27th day of September, 2019.

Jo Elizabeth M. Wheat, CVR-CM/M-GNSC
Hearings Reporter, PSC/SC
My Commission Expires: January 27, 2021.
